ED Entered STN: 30 Apr 2004

AB A cosmetic method to prevent and/or smooth the facial wrinkles and/or to slacken the features of the face, comprises topical application of a cosmetic composition containing a perfume on the facial skin. When the perfume is applied to the part of skin located between the nose and the upper lip of a human subject subjected to a stress it causes a reduction of at least 0.1% of the muscular activity of the trapezoid muscle, measured by electromyog., as compared to the controls without perfume. A perfume contained natural products (bergamot oil, mandarin oil, and ylang ylang oil) 7%, and synthetic products (aliphatic and aromatic alcs. 13, aliphatic and aromatic aldehydes 13.5, aliphatic and aromatic esters 28.50, synthetic ketones and musks 25, solvents 9, and miscellaneous compds. such as monoterpenes and saturated compds. 4%) 93%. Formulation of an antiwrinkle cream is disclosed.

L33 ANSWER 2 OF 2 JAPIO (C) 2007 JPO on STN

ACCESSION NUMBER: 2004-277407 JAPIO Full-text

TITLE: COSMETIC METHOD FOR SMOOTHING EXPRESSION WRINKLE BY LOCAL ADMINISTRATION OF FRAGRANT COMPOSITION

INVENTOR: ABRIAT ANNE; PETIT BRIGITTE

PATENT ASSIGNEE(S): L'OREAL SA

PATENT INFORMATION:

PATENT NO	KIND	DATE	ERA	MAIN IPC
-----------	------	------	-----	----------

APPLICATION INFORMATION

STN FORMAT: JP 2003-367976 20031028
ORIGINAL: JP2003367976 Heisei
PRIORITY APPLN. INFO.: FR 2002-200213523 20021029
SOURCE: PATENT ABSTRACTS OF JAPAN (CD-ROM), Unexamined
Applications, Vol. 2004

ED 20050203

AN 2004-277407 JAPIO Full-text

AB PROBLEM TO BE SOLVED: To relax face muscles and suppress expression wrinkles by using a specific fragrant composition having relaxing characteristics to a specific striated muscle. SOLUTION: The use of this cosmetic composition containing a fragrant composition containing 5-10 weight % essential oil and 90-95 weight % mixture containing (a) 10-15 weight % alcohol, (b) 10-15 weight % aldehyde, (c) 25-30 weight % ester, (d) 20-30 weight % musk or ketone and (e) 5-10 weight % solvent in a physiologically acceptable medium includes its local application onto the skin of a face. By adding the fragrant composition to a local preparation of 2 ml by 0.5 weight % ratio and applying the preparation onto a skin part between the nose and upper lip of an individual having received with stress, 0.1 % reduction of muscle activity of the mitriform muscle measured by an electromyogram-recording method is obtained as compared with that of a non-fragrant local preparation measured under the same condition. AB The purpose of the present invention is to provide a premix composition comprising (a) a perfume and (b) an amine oxide, wherein the weight ratio of (a):(b) is between 20:1 and 1:1. The inventions further relates to treating compns. comprising either said premix composition or a perfume and an amine oxide in a ratio of 20:1 to 1:1. In said premix composition, the amine oxide serves as a solubility agent for the perfume. The present invention further provides a method of solubilizing a perfume in an amine oxide. The present invention also provides a method of treating a surface with the treating composition of the present invention comprising the steps of applying the treating composition to a surface and wiping said surface. The present invention further provides a process for preparing a premix composition comprising the step of solubilizing a perfume in an amine oxide, wherein the perfume to amine oxide ratio is between 20:1 to 1:1.

AB A process for cleaning soiled garments and fabric materials using a liquid or supercrit. CO2 system, whereby a fragrance system having at least 75% of the ingredients having a relative fabric affinity value (y) of ≥ 4 or having $\geq 60\%$ of the ingredients having a relative fabric affinity value (y) of ≥ 6 is added to the CO2 is disclosed. The fragrance system, once it is applied on the garment and/or fabric material, is substantive and gives a long lasting odor.

ED Entered STN: 25 Jan 2002

AB A perfume composition comprises at least 7.5% by weight of the composition of a first perfume ingredient having b.p. of $\leq 250^\circ$ and ClogP of ≤ 3.0 , and at least 35% by weight of the composition of a second perfume ingredient having b.p. of $\leq 250^\circ$ and ClogP of ≥ 3.0 , the composition being further characterized in that at least one first or second perfume ingredient is present in an amount of at least 7% by weight of the composition. The perfume ingredients are selected from esters, ketones, aldehydes, and alcs. A cleaning composition comprising the perfume composition is also described. For example, a perfume composition contained allyl caproate 4%, citronellyl acetate 3%, δ -damascone 3%, Ethyl-2-Me butyrate 12%, flor acetate 4%, frutene 8%, geranyl nitrile 1%, ligustral 10%, Me dihydrojasmonate 25%, nectaryl 3%, neobutanone 0.3%, oxane 0.01%, and tetrahydrolinalool 26.69%. The cleaning composition suitable for use in cleaning hard surfaces, e.g., kitchens, bathrooms, car interiors or exteriors, household appliances, or dishware contains as an essential feature 0.005-2% of perfume composition described.

AB The present invention relates to aqueous compns. comprising an odor controlling agent and select sanitizing agents for deodorizing and sanitizing skin surfaces. Articles of manufacture and methods of deodorizing and sanitizing the skin using disclosed compns. are also disclosed. A sanitizing and deodorizing spray contained ethanol 40, water 54.8, isopropanol (99%) 3, hydroxypropyl beta-cyclodextrin 1, zinc chloride 1, and benzalkonium chloride 0.2%.

 AB Epidemiol. studies have described an increasing prevalence of fragrance allergy and indicated an association with hand eczema. Fifty-nine domestic and occupational products intended for hand exposure were subjected to gas chromatog.-mass spectrometric (GC-MS) analyses to test the hypothesis that fragrance chems. known to have the potential to cause contact allergy but not included in fragrance mix (FM) may be common ingredients in these products. A quant. anal. of 19 selected fragrances was performed by GC-MS. Further anal. of GC-MS data revealed the presence of 43 other fragrance chems./groups of fragrance chems. in the products investigated. Among the 19 target substances the most commonly detected were limonene in 78%, linalool in 61% and citronellol in 47% of the products investigated. The FM ingredients were present in these products with the following frequencies: oak moss (evernic acid Me ester) 2%, cinnamic alc. 2%, cinnamic aldehyde (cinnamal) 3%, isoeugenol 5%, α -amylcinnamic aldehyde (amyl cinnamal) 8%, hydroxycitronellal 12%, eugenol 27%, and geraniol 41%. Thus, the chemical analyses of domestic and occupational products indicates that investigation of potential contact allergy related to these products types should consider fragrance allergens addnl. to those in the FM, since these may occur with high frequency.

AB Users of consumer products are invariably and intentionally exposed to complex mixts. in such products. With finished fragrance products, these mixts. may represent 100 or more fragrance raw materials (FRMs). The objective of the described studies was to evaluate the safety of finished fragrance products via the inhalation route. In total, the finished products contained approx. 100 FRMs at concns. of 1% or greater. Major FRMs evaluated included benzyl acetate, coumarin, hydroxycitronellal, musk ketone, 1,3,4,6,7,8-hexahydro-4,6,6,7,8,8-hexamethylcyclopenta- γ -2- benzopyran (HHCB) and phenylethyl alc. Groups of rats or hamsters were exposed by inhalation (whole body) to the mixts. at 5, 9 or 50 mg/m³ for 4 h per day, 5 days per wk for 6 or 13 wk. For each of the fragrance products, the doses used generally represented a 10-100-fold exaggeration of levels expected to be achieved during typical use by consumers. With one exception, the fragrances were aerosolized prior to introduction into the inhalation chamber. The exception product was formulated with a propellant, packaged in a pressurized container and expelled with an automated actuator. In all studies, chamber concns. of fragrance were monitored. Particle sizes ranged from 0.5 to 7.5 μ m, depending on the study. Subchronic exposure to all fragrance mixts. resulted in no toxicol. significant effects on animal survival, behavior, body wts. or weight gains, organ wts., or in hematol., clin. chemical, or urinalysis parameters. No gross pathol. or histopathol. findings related to test material exposures were observed. These studies support the conclusions that the fragrance mixts. would not pose a hazard to product users based on repeated and exaggerated inhalation exposures of animals.

AB In the validation of the discriminant and rank models, structures were
included inadvertently which had also been used in model construction;
therefore, for correct assessment of model performance, the valid number of
compds. evaluated is reduced to 65 from 74 for classification of
allergens/non-allergens, and to 54 for ranking of allergen potency. After
subtracting the original 12 as "indeterminate", and the 9 identified

redundancies, classification performance is 44 correct out of 53, i.e. 83% concordance. As all redundancies were allergens, specificity remains unchanged at 100%; sensitivity is 88% (38/43). Corrected ranking performance is 93% for concordance (50/54), with 66% specificity (7/11) and 91% sensitivity (41/43).

AB Quant. structure-activity relationship (QSAR) models which predict both skin penetration and cell mediated immunity for small mol. weight non-electrolytes developed earlier were validated on 74 known allergens and non-allergens chosen among fragrance chems. in common use to test discriminating and grading power. While the test set used for classification was based on experience in humans exclusively, the rank model was tested for sensitization potency including guinea pig data also. In the classification test, 12 of 74 compds. fell in the indeterminate range and were non-classifiable by the present QSAR model. On the remaining 62 compds. the model performs with 90% sensitivity and 100% specificity at 92% concordance. The rank model correctly grades 65 of 74 compds. (88% concordance), with 60% specificity based on exact prediction of non-allergens (NON), and 95% sensitivity on allergens (ACD) allowing for a variance of \pm one level among weak, moderate and severe ratings. In combination, the 2 models perform with 93% overall concordance on the test set of 74 compds.

AB There is a regulatory requirement for the potential of a new chemical to cause skin sensitization to be assessed. This requirement is presently fulfilled by the use of animal tests. In this study a data base of heterogeneous organic compds. from the guinea pig maximization test has been subjected to multivariate QSAR anal. The compds. were described both by whole mol. parameters and structural features associated with likely sites of reactivity. Principal component anal. was applied to the data set and although it functions reasonably well to reduce the dimensionality of a large data matrix, it is only moderately useful as a predictive tool when descriptors were chosen rationally. Stepwise discriminant anal. produces a fourteen parameter model, of which twelve were structural features associated with reactivity. This however predicts only 82.6% of compds. correctly after cross validation. There is trend for the linear discriminant anal. model to predict compds. as non sensitizers, suggesting that the parameters incorporated were not wholly suitable for discriminating between the two classes. Another criticism of linear discriminant anal. is that it may be unable to cope with the likely embedded data structure. With this in mind, the structural alerts may be better employed in an expert system, to identify potential hazard, where they will not suffer the limitations of a statistical model.

AB Prototype fragrances, prepared from common fragrance components, were extracted with water, recovered, and characterized by gas chromatog. before and after the water treatment, revealing a significant loss of the more water soluble components. Unextd. prototype fragrances were also microencapsulated by a gelatin/gum arabic coacervation process. The microencapsulated fragrance oils were recovered from the microcapsules, using pepsin enzyme to open up the capsules. Comparison of GC results of microencapsulated fragrance oil vs. unencapsulated oil showed many of the changes could be ascribed to solubility losses of the more water-soluble components to the process water. Deliberate inclusion of toluene as a fragrance component in one of the prototype fragrances showed that some losses of highly volatile fragrance components can be extracted during microencapsulation; but because most fragrance components do not approach the volatility of toluene, such losses are expected to be minimal. Chromatograms taken before and after microencapsulation of two com. fragrances are discussed.

NOVELTY - A fragrance composition comprises (in weight%): mixture (11-60) of odoriferous materials, ethanol (51-80), and decamethyltetrasiloxane (3-30), each based on the total weight of the composition.

USE - The fragrance composition is used as eau de cologne, an eau de toilette, a perfume, or an aftershave lotion (claimed).

ADVANTAGE - The fragrance composition produces an economically acceptable compromise, by retaining a large amount of ethanol, which is cheap, without loss of stability or a detrimental change in the olfactory characteristics of the fragrance over time.

AB US 4515705 A UPAB: 20060104

Compsn. comprises (a) a proteolytic enzyme to provide and activity of 0.005-0.1 Anson units/g,compsn., the enzyme having no detectable odour at a concentration less than 0.002 Anson units/g distilled water; and (b) 0.001-2 weight% of a perfume selected from phenyl ethyl alcohol, linalool, geraniol, citronellol, cinnamic alcohol, isobornyl acetate, benzyl acetate, p-tert.butyl cyclohexyl acetate, linalyl acetate, dihydro-nor-dicyclopentadienyl acetate or propionate, amyl salicylate, benzyl salicylate, p-isopropyl alpha-octyl hydrocinnamic aldehyde, hexyl cinnamic aldehyde, hydroxy citronellal, heliotropin, anisaldehyde, citral, dextro limonene, coumarin, ionone gamma methyl, methyl beta naphthyl ketone, gamma undecalactone, eugenol, musk, xylol, 1,3,4,6,7,8-hexahydro-4,6,6,7,8,8- hexamethylcyclopenta -gamma-2-benzopyrane, 4-acetyl-6-tert.butyl -1,1-dimethyl indan, 6-acetyl-1,1,3,4,4,6 - hexamethyl tetrahydronaphthalene, beta naphthyl ethyl ether, methyl eugenol, methyl cedrenyl ketone, patchouli, lavandin, geranyl nitrile, alpha ionone, alpha-beta ionone, benzyl isoeugenol, amyl cinnamic aldehyde, beta gamma hexenol, orange CP, o-tert.butyl cyclohexyl acetate, 2-methy--3-(p-isopropylphenyl) propionaldehyde, trichloro methyl phenyl carbinyl acetate, nonanediol-1,3-acetate, methyl dihydro jasmonate, phenoxy ethyl isobutyrate, citronella, citronellal, citrathal, tetrahydromuguol, ethylene brassylate, musk ketone, musk tibetine, phenyl ethyl acetate, oakmoss 25%, hexyl salicylate, eucalyptol and mixtures thereof. USE/ADVANTAGE - The comps. is a detergent comps.especially heavy duty, containing 1-75% surfactants. Proteolytic enzymes preps. have unpleasant odours. Present use of a highly refined stock, combined with a selected perfume, reduces or eliminates malodours.

ABSTRACT: The purpose of this study was to investigate the incidence and etiology of cutaneous reactions caused by cosmetics, with an emphasis on perfume sensitivity. Nineteen control subjects and 31 patch test clinic patients (16 with a history of adverse cosmetic reactions) were examined for sensitivity by history, open and patch testing using the North American Contact Dermatitis Group (NACDG) fragrance screening series and 11 other common allergens found in cosmetics. Contact urticaria was very frequent to certain chemicals; however, patients with a history of cosmetic sensitivity were not found to have a significant increase in positive reactions when compared to controls or patients with eczematous skin. Twelve subjects had positive patch test reactions, most of which were not clinically relevant. Three patients with a history of cosmetic

sensitivity had positive reactions, only 1 of which was in the fragrance screening series (cinnamic alcohol). There were 6 reactions in patients with eczematous skin, 4 of which were to preservatives. Three controls had positive reactions, each to thimerosal. A history of cosmetic sensitivity was not confirmed by open and closed skin testing in our subjects.
